

## Urban Europe and NSFC

Europe – China joint call on Sustainable Urbanisation in the Context of  
Economic Transformation and Climate Change:  
Sustainable and Liveable Cities and Urban Areas

Funded by  
NCN (Poland), project UMO-2018/29 / Z / ST10 / 02986  
NSFC (China), project 71961137011  
FFG (Austria), project 870234

## UNCNET

**Urban nitrogen cycles:  
new economy thinking to master the challenges of climate change**

**D9/3: Outreach report and summary**

Due date of deliverable: **31/01/2022**

Actual submission date: **31/08/2022**

Start Date of Project: **01/04/2019**

Duration: **35 months + 6 months**

Organisation name of co-chairs for this deliverable: **IIASA**

Authors: Katrin Kaltenegger, Wilfried Winiwarter

Dissemination Level		
<b>PU</b>	Public	<input checked="" type="checkbox"/>
<b>PP</b>	Restricted to other programme participants (including funding agencies)	<input type="checkbox"/>
<b>RE</b>	Restricted to a group specified by the consortium (including funding agencies)	<input type="checkbox"/>
<b>CO</b>	Confidential, only for members of the consortium (including funding agencies)	<input type="checkbox"/>

## 1. Executive Summary:

The outreach of the project progress and results was organized on different platforms. One platform was the UNCNET website (<https://www.uncnet.org/>). This website contains a general description of the project, its aims and work packages and its consortium. Additionally, all deliverables can be downloaded as well as all open-source publications are directly accessible via web link. A link to the website of the respective publisher is also provided for non-open-source publications, but access may require a license. Another section on the website informs the visitors about more recent activities such as meetings and stakeholder activities. The final stakeholder conference was advertised through pop-ups on the website as well. Another platform was a Twitter account where many project activities such as publications, preliminary results per work package, and final results in the form of “postcards” were presented. Dissemination also took place during the stakeholder meetings and through publications and presentations at conferences, all of which are listed here.

## 2. Objectives:

The main objective of the dissemination activities was to distribute the preliminary and final project results to people with diverse backgrounds who could become interested to contribute to or use these results.

## 3. Activities:

- Publishing papers
- Presenting UNCNET at conferences
- Updating the UNCNET website
- Updating the Twitter account

## 4. Results:

Results of these activities are the website (<https://www.uncnet.org/>), the Twitter account ([https://twitter.com/UNCNET\\_project](https://twitter.com/UNCNET_project)) as well as a list of conference presentations and publications. However, outreach will continue beyond the project period and three conference talks are already planned for October 2022 and several future joint publications, making use of the plentiful project results are already being discussed.

**Website and Twitter:** Please see Annex I and Annex II

### Conferences (Past):

Winiwarter, W. (2021, June). “Nitrogen balances in urban areas: purpose and potentials” [Presentation]. INI 8th Global Nitrogen Conference, online.

Greinert, A. (2021, September). “Anthropogenic soils in the context of water and chemical elements circulation in urban environment” [Presentation, book contribution]. Plant productivity and food safety: Soil science, Microbiology, Agricultural Genetics and Food quality, online.

## Conferences (Future):

- Kaltenegger, K., Fan, X., Guéret, S., Suchowska-Kisielewicz, M. & Winiwarter, W. (2022, October) Urban Nitrogen Budgets – Comparison Across Cities. XXI International N Workshop, Madrid, October 24-28, 2022.
- Suchowska-Kisielewicz, M., Winiwarter, W., Amon, B., Kaltenegger, K., Jędrzak, A., Myszograj, S., Pluciennik, E., and Greinert, A. (2022, October). The fate of nitrogen in the urban area – the case of Zielona Góra, Poland. XXI International N Workshop, Madrid, October 24-28, 2022.
- Guéret, S., Kaltenegger, K., Fan, X., Bai, Z. and Winiwarter, W. (2022, October) From Urban Nitrogen Budgets to Sustainable Development Goals: N governance in Urban context. XXI International N Workshop, Madrid, October 24-28, 2022.

## **5. Deviations and reasons:**

Strong representation of UNCNET had already been planned for the INI conference scheduled for Berlin, May 2020, including the organization of a back-to-back policy meeting in Zielona Góra. Due to the Covid-19 outbreak, the conference had to be postponed and finally took place virtually in 2021 – at which occasion only key UNCNET results were shown. Also the policy meeting had to be cancelled due to the continuing uncertainty of the situation and travel restrictions still being in place for some project participants. Conference dissemination thus still is ongoing, and will extend beyond the formal project end. This and further scientific publications related to UNCNET will continue to be updated on the web page.

## UNCNET

Urban Nitrogen Cycles: New Economy Thinking to Master the Challenges of Climate Change

Urban life is characterized by high population density. Small scale environmental issues easily affect a large number of people. Nitrogen compounds contribute to very different environmental issues, some of which happen at very small scales. Human activities responsible for the release of such compounds are especially notable in cities – with special forms of high-value agricultural production in close proximity of consumers, with combustion to supply the high energy demand, and with waste materials concentrated where the number of people is high. In the UNCNET project we work on systematically developing “urban nitrogen budgets” to understand the reasons, pathways and possible intervention points of the release of such compounds. Specifically, we address the technological and the behavioral options that enable such interventions – considering the reclamation of useful materials like nutrients as possible pathways to support the development of a circular economy. Nitrogen budgets and their impacts will be studied in four European and Chinese cities (Vienna, Shijiazhuang, Beijing and Zielona Gora), learning from the differences – these impacts not only relating to pollution but also addressing the needs of climate protection. An organized stakeholder process will allow to familiarize city authorities and other interested parties to contribute to and learn from the project’s experience.

## About Us

UNCNET is a project funded under the JPI Urban Europe / China collaboration, project numbers UMO-2018/29 / Z / ST10 / 02986 (NCN, Poland), 71961137011 (NSFC, China) and 870234 (FFG, Austria).

Coordinator: International Institute for Applied Systems Analysis (IIASA), A-2361 Laxenburg, Austria

Main scientific contact: Wilfried Winiwarter (winiwart[at]iiasa.ac.at)

## Work Packages

The overall work within UNCNET has been divided into work packages with a clear assignment to partners responsible. This assignment meets the expertise of the respective partners, typically allowing two partners to share the work within a work package. No differentiation by country/region has been made, such that some work packages link partners from two continents, while others are mostly constructed within a single country. The main exception is the urban stakeholder work package (WP8), where only methods are exchanged between the countries, as stakeholders are expected to be confident in using their national language only. Here project partners and stakeholders will need to interact in Chinese, German, and Polish, respectively. The work packages are described in detail below, except for the administrative WP1, Coordination.

WP2: Framework

WP3: Atmosphere

WP4: Soils

WP5: Agriculture

WP6: Consumption

WP7: Urban N  
Budgets

WP8: Stakeholders

WP9:  
Dissemination

## Project Partners

### IIASA

The International Institute for Applied Systems Analysis ([IIASA](#)) is an international scientific institute that conducts research into the critical issues of global environmental, economic, technological, and social change that we face in the twenty-first century. Founded in 1972, IIASA now ranks among the leading think tanks globally in the science-policy interface, specifically in the context of global change. Situated in Laxenburg near Vienna, Austria, over 300 scientists from nearly 50 countries and widely different disciplines collaborate on issues related to climate and environmental sciences, using advanced scientific models to tackle imminent science questions relevant for policy. 23 countries, representing almost two thirds of the world population, are IIASA members via their national member organization (typically Academy of Sciences or National Research Councils) and make for a truly global perspective of the research performed.

### UZG

The University of Zielona Góra ([UZG](#)) belongs to the elite group of 18 classical Polish universities. The mission of the UZG is to promote equal opportunities for the development of the region and its inhabitants and to increase the intellectual, economic and artistic potential by educating with high quality professional staff and conducting advanced research. The academic staff participate actively in the European Research Space and the European System of Higher Education. The Institute of Environmental Engineering is active in the fields of waste water and waste technology, applied ecology, hydrology and applied geology, land protection and reclamation, networks and sanitary installations. Recent research activities focused on: Modeling processes in environmental engineering (2017); Environmental conditions and effects of waste management (2016-2017); Environmental conditions of rational energy management (2014); Risk of environmental hazard and the possibility of its minimization (2013).

### CAS

The Center for Agricultural Resources Research, Institute of Genetic and Developmental Biology, The Chinese Academy of Sciences (CARR, [CAS](#)) was known as Shijiazhuang Institute of Agricultural Modernization that was founded in 1978. The CARR, CAS is considering the particular agricultural needs of efficient utilization of water and nitrogen in North China Plain as well, has put stress on the following areas: farmland water transfer, crop and livestock flow, ammonia and nitrous oxide emission measure, and manure management etc.

### PKU

Peking University ([PKU](#)) is a comprehensive and national key university. Founded in 1898, PKU was the first national university covering comprehensive disciplines in China. The university has now effectively combined research on important scientific subjects with the training of personnel with a high level of specialized knowledge and professional skill as demanded by the country's socialist modernization. It strives not only for improvements in teaching and research work, but also for the promotion of interaction and mutual promotion among various disciplines.

### brainbows

[brainbows](#) information management gmbh is a consultancy company from Vienna which specializes in sustainability, energy & climate protection. With a permanent staff of 12 highly qualified professionals, we see ourselves as a "one-stop shop" for consultancy and communication services. brainbows pools its know-how in four pillars: sustainability & CSR, energy & climate protection, strategic advice, events & stakeholder communication. Especially in the field of stakeholder communication the company shows a broad experience. From large international conferences and symposia such as the Austrian World Summit and professional stakeholder events such as the annual REWE Stakeholderforum to special workshops and roundtables, brainbows designs and organises various measures and processes. The environment management and stakeholder involvement in large infrastructure projects, for example for the City of Vienna, are also among the focal points of brainbows' work.

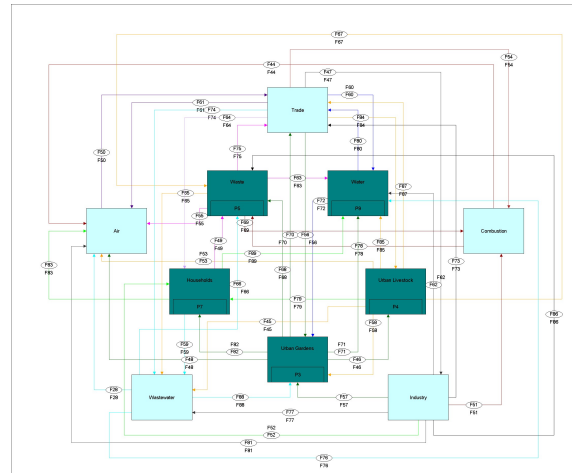

### E. C. O.

[E.C.O.](#) Institute of Ecology is a specialized company for planning, consulting, research and training for nature conservation and protected areas since 1992. The company has been established in the form of a private limited company and is a licensed "Technical Office for Ecology". The company employs a permanent staff of 18 highly qualified professionals from the fields of ecology, geography, landscape planning and biology who work at the interface between applied research and practice. The company frequently conducts interdisciplinary applied research in the field of management of natural resources, protected areas and integration of conservation objectives into policy. E.C.O. develops solutions in cooperation with different stakeholders, researchers and project partners. Since 2012 the company is responsible for managing the largest urban protected area of Klagenfurt/Austria working together with a wide variety of urban stakeholders and interest groups.

## WP2: Model Framework

Creating the outline for the overall system model to describe urban nitrogen flows will be decisive to recombine inputs received from the respective project elements. In this work package, foundations will be laid early in the project for all other elements to provide their results in proper shape and format. The model framework will make sure that inputs are harmonized, rendered comparable, and mismatches reported back to the other work packages for refinement.

- Using the open-source software STAN (Vienna University of Technology), a primary structure of relevant nitrogen flows in urban surroundings will be created. Concepts to consider import/exports of agricultural material and biogenic waste will be included, taking into consideration the specific situation of urban agriculture.
- A concept of uncertainty will be developed to handle uncertain or redundant information consistently and understand its effect on the outcomes.
- Harmonization of inputs will be achieved by providing feedback to budget elements (other work packages) on probable / improbable result.

## WP3: Atmospheric Impacts and Effects

Emissions of reactive nitrogen to the atmosphere, including both NO<sub>x</sub> and NH<sub>3</sub>, have important contributions to the formation of PM<sub>2.5</sub> air pollution in urban atmosphere over the world. The North China Plain, particularly the Beijing–Tianjin–Hebei (BTH) megacities, has been experiencing heavy PM<sub>2.5</sub> air pollution in recent years, causing public concerns on human health.

In this work package, we will investigate the impacts of different mitigation pathways for nitrogen management in the urban agricultural activities on PM<sub>2.5</sub> air pollution in the project test areas (greater Beijing as well as Europe), and their surround regions.

- Based on different scenarios of urban agriculture and considering different mitigation pathways of nitrogen management, the amount of ammonia emitting to the atmosphere from agricultural activities, including fertilizer applications and livestock waste will be estimated.
- Results of PM<sub>2.5</sub> concentrations at fine resolution from two atmospheric chemistry models (GEOS-Chem model and WRF-Chem) will be evaluated using present-day emission inventory. GEOS-Chem can cover both China and Europe at a horizontal resolution of  $1/4^\circ \times 5/16^\circ$  (~25 km), and WRF-Chem runs at horizontal resolutions of 36 km and 4 km over the BTH region.
- The ammonia emission estimates from the first phase of the work package will be implemented to both atmospheric chemistry models, and their effect on the PM<sub>2.5</sub> concentrations in the urban atmosphere will be quantified.

## WP 4: Soil Impacts and Leaching

Agricultural soils account for considerable nitrogen leaching to groundwater. In China, especially in the Beijing–Tianjin–Hebei (BTH) region, this exceeds 50%. This poses a risk of adverse health effects such as methaemoglobinaemia in infants and gastric and oesophageal cancers for both urban and rural populations. In this work package, we will quantify regional-scale N leaching from agricultural soils at high spatial resolution and assess their potential health risks, as well as to optimize agricultural management practices to mitigate health risks.

- Based on massive surveys related to agricultural managements and county-scale statistic registers (Zhou et al., 2014), we will compile a high resolution and climate-adaptive N inputs and irrigation dataset, such the synthetic fertilizers, manure, crop residues, human excreta, and irrigation amounts. Combining the datasets with local schemes of fertilization and irrigation, we finally develop a high-resolution and real-time N inputs and irrigation datasets from targeted cities or regions.
- Both land surface model (ORCHIDEE-CROP, Wang et al., 2017) and flux upscaling approach (Gao et al., 2016, Hou et al., 2017) are applied for the estimates that are constrained by multi-source observations of N leaching fluxes. Regional N leaching at different soils and the associated N flow in aquifer groundwater will be quantified under different agricultural management and climate change.
- Based on probabilistic effect-response functions, we will assess negative effects of N applied in urban and rural agricultural soils on human and livestock health, and implement N inputs and irrigation datasets from different scenarios of agriculture management and climate change to models, thereby quantifying how they affect the N-related concentrations in the urban groundwater.

## WP 5: Urban Agriculture

Agriculture plays an important role in the urban N flow (Ma et al., 2014). The diverse flows of N will be investigated and guidance to assess them will be provided. In particular, the following specific urban challenges will be treated: specific urban crops, urban livestock systems, and the prevalence of import and export of food and feed as a central element of urban metabolism.

- Estimations of the location and scale of different livestock production systems in the urban area and estimations of diet protein level and manure management situations in urban area will be used to quantifying changes of N flow and losses from the complicated urban livestock production chain.
- The food and feed imported by cities as well as an estimation of N flow of external imported agricultural products will be quantified .
- The coupling rate of crop and livestock production and an estimation of agricultural N flow though the cities will be quantified and the urban agricultural N flow will be linked with urban sustainable development goals.

## WP 6: Quantifying N Pools and Recycling N Flows

Nitrogen compounds are embedded in many goods used by humans. They are being stored with other material in the settlements, forming N pools, but are largely also transferred in waste treatment. The aim of this work package is to develop guidance how to assess detailed information required to quantify N pools and fluxes related to consumption and storage of goods in private and public spaces.

- Quantification methods for the stocks and flows of N compounds in waste and wastewater will be developed and described.
- Methods developed for known N contents will be extrapolated to other compounds. Visual and textual methods of waste analysis will be used to assess N flows with lacking analytical information, and to estimate the uncertainty introduced.
- Waste and wastewater N as well as technology information on treatment methods will be used to quantify downstream fluxes (runoff, atmospheric release, groundwater seepage).
- Estimates of N content in human dwellings and constructions will be developed generally, again based on the available data on waste composition, in order to extrapolate N pools in the human sphere.
- The potentials for extracting valuable N compounds from the waste processing and returning them as a valuable raw material will be assessed using the respective waste flow for a circular economy.

## WP 7: Urban Nitrogen Budgets

Urban Nitrogen Budgets represent a key project result. The methods developed in this project will be applied to the four test areas, reflecting the home bases of the participating institutions. Implementation of the methods worked out in the project will demonstrate general feasibility. Comparisons to be drawn from the results of the four cities (2 Asian megacities, one large and one small European city) will allow to assess the value of the concept. The potentials for reclaiming N material (and other circular economy impacts) in the urban budgets will be quantified to alter the nitrogen flows for each of the cities.

## WP 8: Urban Stakeholders

The WP aims to discuss the project results and develop practicable approaches and solutions to implement them in practice. This requires to gather support needed from people involved in the process and to bring together the relevant stakeholders from urban areas, especially city authorities. In the internal project logics, a special focus will be on the Austrian stakeholders. Within the framework of a structured stakeholder process, selected actors will be involved in the project in several workshops in the city of Vienna and in the small town of Klagenfurt in Carinthia / Austria. In this process stakeholders are being involved early to contribute to the design and shape the outcome of the research, but also take over responsibility and ownership. Actors include city authorities, NGOs and citizens' representatives, companies, experts and planners as well as other interested parties. A recommendation paper will be prepared. Interaction with potential users of the concept of Urban Nitrogen Budgets and with other potentially affected parties (stakeholders) is a key concept of the UNCNET project. It will also be applied, in a less explicit manner than for Austria, in the other regions of investigation (Poland, China) to better understand input-output relationships and management options of individual stakeholders.

## WP 9: Dissemination and Contribution to Policy Processes

Results from a scientific project need to be communicated appropriately in order to achieve an impact. Three main channels of communication to be coordinated within have been identified, which reflect the habits of very different interest groups. In UNCNET, all of these are being coordinated in this work package. In the first channel, scientific results are will be shared via the classical instruments in science – conference presentations and peer-reviewed publications. The second channel aims to inform groups of general interest in science, like media, schools etc. and uses instruments such as social media and web page to share project results. Finally, an impact on policy processes can be achieved by directly contribute to policy processes. Active outreach to international policy processes focusing on environmental issues (Sustainable Development Goals, UN Habitat Assembly, and the UNEP project “Towards an International Nitrogen Management System – INMS”) will be a decisive element for the successful dissemination of project results.

## News

### Final Stakeholder Conference

On May 31 our final stakeholder conference took place in Vienna. Following input by Mark Sutton and Ika Djukic from the Austrian Environmental Agency (UBA), we presented how the expertise from each partner institute was fused in the development of the urban N budgets for our four test areas. Differences as well as similarities between these test areas were explained and the key messages describing the project results were developed. These results were more broadly discussed with local stakeholders from industry, administration and academia, as well as with Nitrogen budget experts joining the conference from the [Expert Panel on Nitrogen Budgets](#) who held their meeting back-to-back on the next day. These insightful discussions gave us a better ideas of potential uses and ways forward for our urban N budget. Have a look at our [presentations](#) for more information on the topics discussed.

### Stakeholder Conference 2022

We are delighted to announce that after two fruitful stakeholder meetings in Klagenfurt and Vienna, our final stakeholder conference will take place on May 31 in Vienna. Join us to learn more about our project and exchange your thoughts with expert from around the world. Register [here](#).

### Stakeholder Workshops in Austria

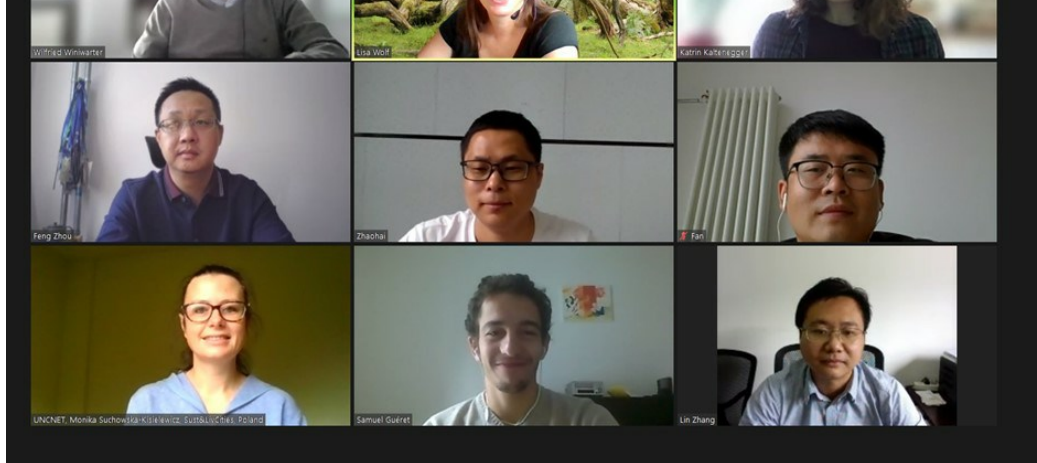

On October 12 and 14, we organized stakeholder workshops in Klagenfurt and Vienna. We welcomed participants of different professional background and area of expertise, allowing for a fruitful exchange. During this exchange the first results for the Austrian test areas (Vienna, Vienna surrounding and Klagenfurt and Villach) were discussed as well as first comparisons between these areas and the Polish test areas (Zielona Góra, Zielona Góra new district). The focus in these discussions was on how to improve the presentation of the project outcomes to make them more understandable and applicable to a broader audience, and to identify items/results of specific value for the stakeholders.

### UNCNET Annual Meeting 2021

This year's annual meeting and second project plenary again had to be held online. Sessions were organized for September 16 and 17, 2021. Project progress by methodology, by test area, and approaches for comparison were discussed. A high level of interaction between teams has been achieved already, as also demonstrated by numerous joint scientific publications. Interaction with stakeholders remains a priority issue, aiming for best use of top science for public purposes. October will see the next stakeholder workshops, including first results for an urban Nitrogen budget for the Klagenfurt/Villach region. Stay tuned to learn about upcoming activities and results!

## Largest in-person UNCNET meeting since kick-off

IIASA welcomed Monika Suchowska-Kisielewicz and Lisa Wolf in Laxenburg (Austria) for the first meeting since kick-off to involve participants from two countries and three institutions. Goals of this meeting were to discuss and compare results of the respective urban N budgets for Vienna and Zielona Gora and discuss the stakeholder process in Poland as well as the upcoming stakeholder workshops in Vienna and Klagenfurt.

## Global Nitrogen Conference 2021

The 8<sup>th</sup> global Nitrogen conference of the International Nitrogen Initiative (INI) was held online from 30<sup>th</sup> of May to 4<sup>th</sup> of June 2021. As a contribution to this conference, Monika Suchowska-Kisielewicz presented her work on [assessing the efficiency of Nitrogen removal from wastewater](#) and Wilfried Winiwarter presented the framework of [urban Nitrogen budgets](#) derived within the UNCNET project. Being able to disseminate the ideas and outcomes of the UNCNET project we equally profited from the plentiful program of the INI inspiring further activities for UNCNET.

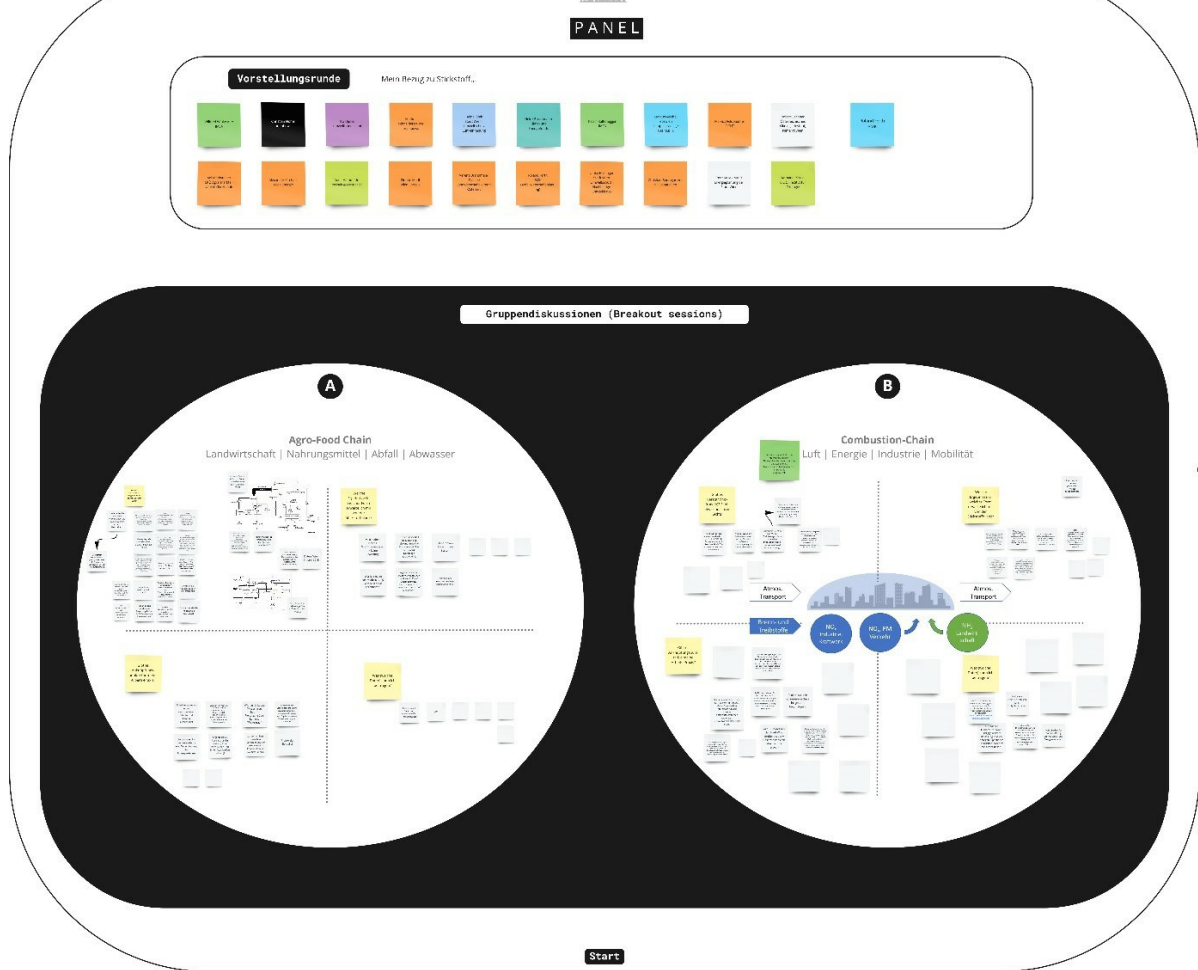

## Paper published describing the UNCNET Framework

On December 15, 2020, our review paper on urban N budgets was published in the Journal of Integrative Environmental Sciences. We used this paper to derive a framework and key elements for further analysis from existing work on urban N budgets. Specifically, we were able to clearly separate the agri-food chain and the energy-chain of nitrogen flows that we will use in the budget calculations and benchmarking of the respective test areas in the UNCNET project. Have a [look!](#)

## Stakeholder Workshops Klagenfurt/Vienna 2020

With a slight delay and a change of venue, the stakeholder workshop for Klagenfurt and Vienna took place online on 13<sup>th</sup> and 17<sup>th</sup> of November 2020. A combination of Zoom and the virtual Whiteboard Miro was used to facilitate and enhance the interaction between and with our participants. As no nitrogen budget is to be calculated for the city of Klagenfurt, the participants of this first workshop discussed the general framework of urban N budgets and the usefulness of the concept for their work. In the second workshop, a more detailed discussion on data requirements and availability was possible due to the vivid participation of representatives of Vienna city administration and of other stakeholders. Altogether the discussions in both workshops enabled us to get a more complete picture of the requirements to develop urban N budgets.

## UNCNET Annual Meeting 2020

The annual meeting 2020 had to be moved to September 10 and 11, and had to be held online – both a consequence of the pandemic. In two 1.5 hour sessions each day, we discussed the progress of each work package as well as the progress of the urban N budgets for each test area. The meeting clearly showed that although the global health crisis altered workflows and interactions, significant progress was achieved by all partners.

## Kick-off Meeting

From the 2<sup>nd</sup> of June to the 3<sup>rd</sup> of June the Kick-off meeting of the UNCNET project took place in Beijing. During this meeting with participants from Poland, China and Austria, expertise were exchanged and requirements for each work package were determined in order to define system boundaries and clarify each participating institution's role in this project.

## Public Project Repository

The following list covers all outputs (deliverables, products and publications) allocated to the UNCNET project. As much as possible and useful in the context of project development, documents are made accessible via direct download or links. We expect the repository to be maintained beyond the duration of the project (April 1, 2019 – February 28, 2022, 35 months).

### Deliverables:

D1/1: Kick-off meeting report including project inception report (not publicly available)

D1/2: Report from the first project plenary – [CLICK HERE](#)

D1/3: Report from the second project plenary – [CLICK HERE](#)

D2/1: Draft concept of urban nitrogen flows. To download this document – [CLICK HERE](#)

D2/2: Final concept of urban nitrogen flows including uncertainty considerations. To download this document – [CLICK HERE](#)

Erratum D2/2: Correction of the final concept of urban nitrogen flows including uncertainty considerations. To download this document – [CLICK HERE](#)

D2/3: Using probability approaches to inform, revise and improve contributions on the respective nitrogen flows. To download this document – [CLICK HERE](#)

D3/1: Estimates of ammonia emissions from urban agricultural activities. To download this document – [CLICK HERE](#)

D3/2: A quantitative estimate of the impacts of ammonia emissions on urban PM2.5 air quality. To download this document – [CLICK HERE](#)

D4/1: Development of high-resolution N inputs and irrigation datasets from agricultural soils. To download this document – [CLICK HERE](#)

D4/2: Land surface modeling simulation of N leaching and health effects assessment. (not publicly available)

D4/3: Optimization of urban agriculture management to mitigate groundwater N pollution under different climate changes. (not publicly available)

D5/1: Draft concept of urban agricultural nitrogen flows. To download this document – [CLICK HERE](#)

D5/2: Clear concept of urban agricultural nitrogen flows. To download this document – [CLICK HERE](#)

D6/1: General guidance to quantify N in waste and waste water. To download this document – [CLICK HERE](#)

'Waiting until we near some suggested limit for nitrogen deposition and other pollution will just permit us to continue to a point where it is too late.' - William Schlesinger, biogeochemist  
<https://t.co/EDCQh5SIJ6>

### Urban Nitrogen Cycles

- Nitrogen is the main component of air, accounting for 80%.
- It is a common element in the universe, estimated at about seventh in total abundance in the Milky Way and the Solar System.
- Global atmospheric nitrogen cycle (N<sub>2</sub>O) mole fractions have increased from a pre-industrial value of ~295 nmol/mol to ~310 nmol/mol in 2005.
- Human activities account for over one-third of N<sub>2</sub>O emissions, most of which are due to the agricultural sector.
- Nitrogen occurs in all organisms, primarily in amino acids (and thus proteins), in the nucleic acids (DNA and RNA) and in the energy transfer molecule adenosine triphosphate.
- The human body contains about 10 g nitrogen by mass, the fourth most abundant element in the body after oxygen, carbon, and hydrogen.

### Urban nitrogen metabolism

More atmospheric nitrogen ( $N_2$ ) is now converted to reactive forms by human activities than by all terrestrial processes on Earth combined. This makes it difficult for both organisms and industry to convert  $N_2$  into useful compounds, but at the same time means that large amounts of other useful energy are released when nitrogen compounds are burned, recycled or decomposed to form nitrogen gas.

UNCNET has led and compared the nitrogen cycles in four cities - Vienna, Wrocław (Poland) and Shanghai and Beijing - in China. Klagenfurt played a special role here, as it served as a pilot region for the large cities.

### Stakeholder process

Especially in urban areas, the accumulation of nitrogen compounds leads to major problems. Ammonia and nitrate from imported food or nitrogen oxides from traffic and industry pollute air and water, accelerate climate change, impair biodiversity and endanger health. Particularly in cities, many people are directly affected. On the other hand, it is precisely here that a better understanding of the interrelationships can help to make sustainable decisions and significantly improve the effectiveness of measures.

During several workshops with different stakeholders, the project results could be discussed, coordinated and reflected with different decision-makers and stakeholders. For political decisions, it is essential to understand what makes stakeholders tick and how robust a scientific statement is.

'Saving nitrogen would not jeopardize food security' <https://t.co/NwpNKFwXft>

## Agriculture and food security

The importance of agriculture in China also can be gauged while the Chinese urban province of Beijing produces more milk than it consumes. Although milk consumption in China is generally much lower than in Europe, for example, it is noteworthy that urban agricultural production requires local exports.

If we shut down the Haber-Bosch plants today, the nitrogen concentration in the atmosphere would decrease again in a few years. This is in contrast to the climate problem, where the atmosphere stores greenhouse gases such as CO<sub>2</sub> for a long time (even after the end of emissions). The effects of global warming "remain in the long term." The question now is: actually, is it not so much human families, the Haber-Bosch process is after all, there are considerations as how to produce synthetic fuels with hydrogen, but we need a lot of energy for this, not from wind farms, the advantage would be producing something that always is there in the cycle so that we don't have to produce it repeatedly.

'According to a new report, air pollution shortens the lives of billions of people by up to six years, making it a far bigger killer than smoking, car accidents or HIV/Aids.' - The Guardian <https://t.co/WTwMp69qLt>

## Households

Households refer to consumers. For a household, the nitrogen parts are calculated based on all products stored in the household (e.g., clothing, furniture, etc.).

The following to the household pool are strictly prohibited: the following from these pools: industrial waste, oil, paint, grease and other petroleum products, household products such as household chemicals, household waste, household waste, or household waste. Other important N flows have related to consumed livestock products, livestock products, flowers and garden fruits (vegetables and household waste). All types of waste are considered, which means that the waste generated is not added to the calculations. With regard to household waste, the N flow is calculated by the household waste management system, and the N flow is calculated by the household waste management system.

Thus, the total amount of transformed nitrogen can be properly assessed.

In addition, one can still calculate the G4 fluxes between households and combustion. These include all G4 on suchs (DIO, NIO, NH, and H4) from the private transport and heating sectors as well as from other household appliances that emit H4.

## UNCNET Project @UNCNET\_project - Aug 4, 2022

The chemical industry used to fix nitrogen requires about 1.3% of global energy, mostly using fossil fuels <https://t.co/G5wIQrjkCq>

'The chemical industry used to fix nitrogen requires about 1.3 % of global energy, mostly using fossil fuels'

Wilfried Winiwarter

### Industry and trade

Nitrogen is used as a starting material for the synthesis of a wide variety of compounds, such as nitrates, ammonia or nitric acid. It is used primarily in the production of fertilizers, but also in the electrical and metal industries. Nitrogen is suitable as a filler gas for transparent lamps, a propellant in sprays, and as a filler in the food and pharmaceutical industries, as well as in medicine. Liquid nitrogen is used because it is suitable for shock freezing or freeze drying, for example for preserving tissue, blood, vaccines and medicines, as well as for storage and fresh poultry products. The accumulation of nitric compounds is not always directly relevant to the environment, but may indicate a potential for later release, for example when things are sent to landfill or groundwater and substances are released there.

ORF

### Urban livestock

Animals play a role in the budgeting of nitrogen flows in a city. Here, we refer to farm animals and domestic animals in cities. A combination of different studies is used. First, one looks at the animal population and the associated feed requirements as well as the excreta.

In the case of urban livestock, one also looks at the number of slaughterhouses. This leads to the meat production. Another study also provides information about the animal transports from or to the respective sites.

'NO<sub>2</sub> makes plants stunt, age faster, it turns their leaves yellow. It over-fertilizes and acidifies soils and waters' - Falter <https://t.co/oLnUZLVkT5>

'NO<sub>2</sub> makes plants stunt, age faster, it turns t yellow. It overfertilizes and acidifies soils an

#### Vegetable production

Plants need nitrogen to synthesize proteins, such as enzymes, and DNA – nitrogen is therefore essential for metabolism. A lot of energy is needed to convert atmospheric nitrogen into chemical compounds that are also available to plants (biological nitrogen fixation). Nitrogen enters soil from atmospheric nitrogen or is transported by lightning strikes.

The addition of nitrogen as fertilizer is essential for plant growth. However, it is especially about 50% of the available nitrogen fertilizer is absorbed globally, even much less. The rest is lost to groundwater or run off to surface waters. Accurate quantification is difficult, depends on local conditions (soil texture, size, precipitation).

This pool contains three sub-pools: agricultural land, horticulture land, and urban green space. Agricultural land includes cropland and grassland. Urban green includes public parks, private gardens, backyards, forests, and green roofs. Horticulture includes horticulture land according to the respective national definition.

Wilfried Winiwarter

#### Waste

Technically, the reduction of nitrogen oxide emissions has been solved. With the help of catalytic converters in cars, or even without catalytic converters in diesel plants of power plants, emissions can be reduced by up to 90%.

Nevertheless, nitrogen compounds such as nitrous oxide (N<sub>2</sub>O) are released into the atmosphere and the air. Households transfer nitrogen to landfills and wastewater through their garbage and sewage. Nitrogen is also passed directly through landfills and wastewater.

Appropriate limits help to make this problem largely a thing of the past. Germany and, according to EU regulations, also emit for sulfur dioxide, particulate matter, and various nitrogen compounds. Each EU country may only emit a certain amount, because emissions also influence the respective neighboring EU countries.
